DENY NANKOV

Student-Athlete, Computer Science & Certificate in Data Science

I started out as someone who was deeply drawn to science and technical problem-solving. In high school, I was especially interested in physics, and eventually pivoted to studying computer science and earning a Data Science certificate. Through classes like computer engineering, system programming, artificial intelligence, machine learning, and data analysis, I built a strong technical foundation in Python, C, and C++. But over time, I realized what really excites me is not just aimlessly writing code. I love taking a messy, complicated problem, breaking it apart, and using data to uncover something meaningful that wasn't immediately obvious at first.

A big turning point for me was my internship at Verustruct. I had a lot of freedom and responsibility, which taught me a lot, but it also showed me that I do my best work in collaborative environments. I realized I'm most creative when I can bounce ideas off other people and combine different perspectives into a better solution. That internship was also my first real exposure to LLMs and Claude APIs, and it made me curious not just about using AI tools, but about understanding where they fail and how to work around those weaknesses. That experience pushed me to think more seriously about how technical tools can actually create leverage in the real world.

Around the same time, I started becoming much more interested in finance. A lot of that came from spending time over the summer having long conversations about markets, interest rates, hedge funds, and private credit, and realizing how intellectually rich that world is. What drew me in was that finance felt like the perfect place to combine everything I liked: data, strategy, uncertainty, and real-world decision-making. Since then, I've tried to lean fully into that intersection. At Kalshi, I worked on testing different machine learning approaches and learned that no model matters unless it survives backtesting. More recently, I worked on a project analyzing 25 years of global currency data to test whether the carry premium is a real edge or just compensation for risk, which gave me a chance to blend quantitative research with financial theory in a way that felt very natural to me.

What ties all of this together is that I'm someone who likes going deep. When I get interested in something, I want to understand it from the ground up, whether that means learning how open-source LLMs are actually built, testing a trading idea with raw historical data, or thinking through how a product survives in a competitive market. I'm also shaped a lot by my background as a competitive swimmer, which taught me discipline, consistency, and how much better I perform when I'm working toward something bigger than myself. At this point, I know I want to keep building at the intersection of technology, finance, and research, because that feels like the space where my curiosity and my skills come together most naturally.

CHRISTIAN LEE*Student-Athlete, Economics & Certificate in Data Science*

I am a third-year Yale student majoring in Economics and pursuing a concentration in Data Science, as well as a member of the Yale Men's Swimming team. Academically, I have built a foundation through coursework in microeconomics, macroeconomics, econometrics, corporate finance, accounting and valuation, game theory, data exploration in R, and introductory machine learning, which together have shaped my interest in financial markets, valuation, strategic decision-making, and data-driven research. My interest first started after taking *AI for Future Presidents* in Spring 2025, where I wrote a final essay on large language models in equity research and the feasibility of analyst replacement. Since then, I have become increasingly interested in how AI can democratize technical expertise and transform financial modeling, research, and market analysis.

Over the following summer, I began experimenting directly with tools like VSCode and GitHub Copilot and threw myself into building a quantitative trading system from scratch, which gave me hands-on exposure to the pipeline from data ingestion and preprocessing to feature engineering, signal generation, risk management, execution, and backtesting. Although I restarted the project many times, that process taught me the value of skepticism, modularity, and avoiding premature complexity. Back at Yale, I placed fifth with Deny in a Kalshi x Yale Undergraduate Hedge Fund Association gas price forecasting competition, where we built a ridge regression-based forecasting framework using scraped historical gas price data, external API inputs, and a Bayesian fusion layer informed by Kalshi market probabilities. That experience taught me practical lessons about recency, feature selection, multicollinearity, and the dangers of overengineering.

I am now applying those lessons to an inflation forecasting project using FRED data, where I am building a cleaned macroeconomic dataset and testing whether machine learning can meaningfully improve on simple benchmark forecasts for inflation direction and magnitude. Across these projects, I have learned that higher-level conceptual understanding is essential to using agentic AI well, which is one reason I decided to pursue the Data Science certificate. I am still early in the process, but I have had enough exposure to know that this is the direction I want to continue pursuing.

HENRY NG*Mathematics & Computer Science*

Henry Ng is a first-year Yale student studying Mathematics and Computer Science with a 4.00 GPA whose profile combines unusual technical depth, research ability, and leadership across machine learning, quantitative finance, and mathematical modeling. His academic foundation includes probability theory, linear algebra, statistical theory, data structures, and discrete mathematics, and he has already translated

that training into advanced research and applied work at an unusually early stage. At Yale's Graph and Geometric Learning Lab, he is conducting research under Professor Rex Ying on trustworthy deep learning for graph-structured data, with current work focused on vision-language models and vision encoders for reasoning over time-series and financial data. Previously, he served as a teaching and research assistant at the Hong Kong University SAAS Data Science Lab, where he helped teach programming to more than 60 students, supervised capstone projects, and contributed to mixed-reality tools for educational applications. His record of achievement is especially striking: he won first place at MIT iQuHack in 2026 for developing a quantum error-correction algorithm, earned the Technical Computing Winner distinction in the 2025 M3 Challenge sponsored by Jane Street for a sophisticated power-demand forecasting and optimization project, and published a first-author paper at ECCV CV4E 2024 on low-cost 3D microplastics analysis using a neural-network-based computer vision pipeline. Alongside this, he is active across several highly selective finance and research organizations, including Yale Alternative Investments, Paragon Global Investments' Systematic Fund, the Yale Undergraduate Hedge Fund Association, and the Urban Philanthropic Fund's Algorithmic Trading Team, where he is working on projects ranging from geospatial AI for wheat futures to implied volatility surface construction in sparse FX markets. Taken together, his background signals exceptional quantitative ability, intellectual range, and execution, making him someone with both immediate technical credibility and very high long-term upside.

KAVIN LI

Student Athlete, Economics & Mathematics and Computer Science & Certificate in Data Science

Kavin Li (4.00 in Econ & Math with Certificate in Data Science) brings a somewhat different but equally useful profile because he seems to sit naturally at the intersection of quantitative ability, economics, and organizational maturity. He is studying math and economics, pursuing a statistics and data science certificate, and already has exposure to investing-related spaces through UP Fund and YUDI. That combination matters because it suggests he is not just quantitatively capable, but also interested in how numbers connect to actual firms, markets, and economic behavior. His listed skills in R, accounting, and Excel also make him someone who could contribute in practical ways beyond purely theoretical research — whether that is company analysis, data work, or helping bridge more technical work with investment judgment.

What makes Kavin particularly interesting is that his profile suggests discipline and composure. His academic record is excellent, but he also has an unusually high-level athletic background: national championships, major swimming achievements, and strong performance on Yale's varsity team. That matters because people who have operated in competitive environments at that level often bring consistency, resilience, and team orientation. Those qualities are valuable in any serious investing or research group, especially one trying to build a real culture rather than just collect smart resumes. His role in outreach for CUSY and his involvement across several groups also suggest he can contribute to the group socially and organizationally, not just analytically. He seems like the kind of person who could be reliable, coachable, and strong in a team environment while continuing to grow into the more technical side of the work.

RUIHAN(HARRY) ZHANG*Mathematics & Computer Science*

Ruihan (Harry) Zhang is a Yale student studying Mathematics and Computer Science whose profile stands out for its combination of elite mathematical talent, early research experience, and strong technical preparation. His academic background is unusually rigorous, with coursework including linear algebra, analysis, probability theory, stochastic processes, abstract algebra, and data structures, and that foundation is reinforced by major competitive distinctions such as qualifying multiple times for the USAMO, USA(J)MO, and USACO Gold. He has already applied this skill set in research, serving as a student researcher on a transformer- and graph-convolution-based electric vehicle charging demand forecasting system, where he helped build a deep learning model for spatio-temporal forecasting; that work earned honorable mention at the Yau Science Award and was published at CSSE 2023. Beyond academics, he has shown real initiative and leadership through the Youth Euclid Association, where as president he organized more than 200 STEM classes for 600+ students, led annual math competitions, and created substantial original learning content spanning competition math through olympiad-level problems. At Yale, he has continued developing his interest in finance and quantitative methods through YSQFO and YUDI, where he has been building exposure to quant strategies, investing, valuation, and financial markets. Taken together, his background signals exceptional quantitative ability, discipline, and long-term potential, making him someone with both immediate technical credibility and meaningful upside in research, quantitative finance, and other analytically demanding fields.

– STRUCTURE –

(1) Yale Undergraduate Alpha Research (public, Yale-facing club)

- Runs an 'educational' curriculum, structurally identical to any top finance club
- 2x/week meetings, workshops, speakers, "research pods"
- Purpose: campus brand + talent identification
- Would summarize as the more quantitative counterpart of YSIG, can take inspiration from their club model
- *Would start Fall 2026 with club application being sent Spring 2026*

(2) The LLC (private, founder-facing)

- Founders can start building trading infrastructure from week 1
- As talent is identified through the club, members get pulled in
- *Can start immediately*

Our understanding: the company Vertus wants a pod structure (they're seeding us with '\$x' capital)

- *Does this mean that we would have to abide by their risk management (risk limits, exposure limits, etc?)*
- *Are they interested in Yale students only? Can we also bring in other students/networks from other schools?*
- *Is there anything binding us in an adversarial relationship?*
- **QUESTIONS TO ANSWER IN CALL ON WEDNESDAY**

– CLUB CURRICULUM –

INITIAL FILTER

- Establishes some level of financial literacy
- Economic overview, market/industry overview, financial statements
- CHALLENGE: Week 1 workshop assigns a take-home coding challenge (pull stock data, compute basic metrics, visualize)
 - WHAT TO LOOK FOR: economic data(ex FRED API) & stock data extraction(ex Yahoo Finance, Alpaca, etc), computing basic metrics organically (P/E ratio, EPS, EV/EBITDA, PV of Equity/Debt, WACC, etc), graphical representations of data that showcase meaningful relationships (interest rates across different horizons, inflation against unemployment (Phillips Curve intuition), historical stock price across different horizons, etc)
 - Equity research reports work as well/stock pitch (DCF valuation, sensitivity analysis, financial modeling)

SECONDARY FILTER

- Quant workshops get harder fast: backtesting, statistical testing, data pipelines
- Hidden filter: "Bonus challenges" at the end of each workshop — optional, harder problems. The people who do these are your pipeline.
- Anyone who stands out gets an informal coffee / conversation with founding team

ADMISSION

- Research pods formation
 - Data Engineering - normalization, extraction, and general cleaning of massive datasets
 - Factor Models - curating a small subset of factors that drive asset returns
 - Sentiment Signals - aggregated emotional, psychological, and behavioral attitude of market participants toward an asset or the overall market
 - Execution Optimization - minimizing costs, slippage, other frictions
 - Risk Systems - volatility, drawback, position sizing, hard limits, portfolio management
- Project work with Toby Moskowitz
- Prime candidates are the ones who:
 - Who writes working code (not just slides)?
 - Who finds real signals in data?
 - Who builds clean pipelines?
 - Who self-directs without hand-holding?

[HIDDEN] TERTIARY FILTER

Unaffiliated with Yale-facing club

- Top performers from pods get invited into pod work with Vertus
- Members will have real contributions to live trading

CHALLENGES

These live on a GitHub repo. Anyone can submit anytime. Quality of submission = your ticket to the inner circle.

<u>Challenge</u>	<u>What It Tests</u>	<u>LLC Role It Maps To</u>
Data Challenge: Build a clean pipeline that pulls, validates, and stores 5 years of daily data for 500 tickers	Data engineering, API fluency, error handling	Data Engineer

Signal Challenge: Find a statistically significant alpha signal, backtest it, report results with proper methodology	Research, statistics, intellectual honesty about results	Strategy Researcher
Infra Challenge: Deploy a Streamlit/Dash dashboard that monitors a paper portfolio in real time	Full-stack, deployment, systems thinking	Quant Developer
Risk Challenge: Build a risk monitoring system (VaR, drawdown alerts, correlation breaks) for a sample portfolio	Risk math, alerting, production thinking	Risk / Portfolio Construction

LLC

While the club is running, founders are building the actual trading operation:

Month	LLC Milestone	Club Milestone
Month 1	Form Delaware LLC, set up brokerage (Interactive Brokers or Alpaca), build data infrastructure, paper trade first strategy	Club kickoff, Weeks 1–4, casting wide net
Month 2	Paper trading → refine, build risk monitoring, start second strategy, legal/compliance basics	Weeks 5–8, workshops escalating, first identified talent
Month 3	Go live with real capital (small allocation), onboard first non-founder contributor from club	Weeks 9–12, pods running, top performers visible

– DOCUMENTS & LEGAL WORK –

For the Club (public-facing)

1. Club one-pager — what Yale Alpha Research is, mission, apply link
2. Application form — brief, collects coding experience + interest areas
3. Semester calendar — the 15-week plan, looks like any top club
4. Workshop slide decks — standard content, but every workshop ends with a bonus challenge
5. Challenge repo on GitHub — "open challenges for members who want to go deeper" (this is the real filter, framed as educational enrichment)
6. Research pod templates — charter, progress tracker, final report

7. Speaker event materials — outreach, pre-event questions, post-event notes

For the LLC (private, founders only)

1. LLC Operating Agreement — member roles, capital contributions, P&L allocation, decision rights
2. Investment Policy Statement — strategy universe, risk limits, position sizing rules, drawdown thresholds
3. Infrastructure spec — data sources, brokerage API, backtesting framework, execution layer, monitoring
4. Onboarding doc for non-founder LLC members — what they're joining, expectations, IP/confidentiality, compensation/equity structure
5. Strategy pipeline tracker — ideas → research → backtest → paper → live, with go/no-go criteria at each stage

– RISKS –

1. Yale policy: Student orgs likely can't be vehicles for outside business operations. Keep the club and LLC fully separate operationally. The club educates; the LLC is a separate entity that members independently choose to participate in. Never commingle.
2. Talent retention: Once you identify someone good, why would they contribute to YOUR LLC vs. starting their own or just going to a quant firm? You need to answer: what's in it for them (equity, experience, portfolio track record, letter of rec, resume line).
3. Founders still learning: You're building the plane while flying it. Be honest about this — bias toward simpler strategies that you understand deeply vs. complex ones that look impressive. First live strategy should be boring and robust.

– IDEAL MENTORS –

TOBY MOSKOWITZ

- Toby Moskowitz is one of the most influential modern financial economists because his research helped explain why patterns like momentum, trend-following, and carry persist across markets, while also showing how information frictions and market structure shape asset prices. Through major papers on industry momentum, local information advantages, price delay, and time-series momentum, he has shaped both academic finance and the way many investors think about systematic trading and expected returns.
 - Moskowitz, Tobias J., and Mark Grinblatt. “Do Industries Explain Momentum?” *The Journal of Finance* 54, no. 4 (1999): 1249–1290.
 - Coval, Joshua D., and Tobias J. Moskowitz. “Home Bias at Home: Local Equity Preference in Domestic Portfolios.” *The Journal of Finance* 54, no. 6 (1999): 2045–2073. This paper appears on Moskowitz’s Yale CV as part of his major publication record.
 - Coval, Joshua D., and Tobias J. Moskowitz. “The Geography of Investment: Informed Trading and Asset Prices.” *Journal of Political Economy* 109, no. 4 (2001): 811–841. This is also listed on his Yale CV.

- Hou, Kewei, and Tobias J. Moskowitz. “Market Frictions, Price Delay, and the Cross-Section of Expected Returns.” *Review of Financial Studies* 18, no. 3 (2005): 981–1020. This paper is listed on Moskowitz’s Yale CV.
- Moskowitz, Tobias J., Yao Hua Ooi, and Lasse Heje Pedersen. “Time Series Momentum.” *Journal of Financial Economics* 104, no. 2 (2012): 228–250.
- Koijen, Ralph S. J., Tobias J. Moskowitz, Lasse Heje Pedersen, and Evert B. Vrugt. “Carry.” *Journal of Financial Economics* 127, no. 2 (2018): 197–225
- **RELATIONSHIP:** Deny is doing his first project with him (Kalshi-related) where he used an open-source github repo (directed to him by Moskowitz) to do some basic data extraction, deduplication, etc
 - Building a relationship with him, him being a mentor would show serious credibility & give us a lot of insight given his extensive experience

PETER SCHOTT

Peter Schott is a Yale economist best known for research on international trade, globalization, and the effects of China trade exposure on U.S. workers, firms, and communities. He is important because his work helped shape how economists understand the “China shock,” trade-policy uncertainty, and the real labor-market and political consequences of trade liberalization.

A few of his most important contributions are:

- “The Surprisingly Swift Decline of U.S. Manufacturing Employment” (with Justin Pierce), which tied major U.S. manufacturing job losses after 2001 to the reduction in uncertainty around U.S.-China trade policy.
- “Trade Liberalization and Mortality: Evidence from U.S. Counties”, which connected trade shocks to broader social outcomes, including mortality.
- Research on trade liberalization and U.S. elections, showing how trade exposure can spill into political behavior.
- Work on export quality, firm heterogeneity, and globalization, which helped explain how firms and countries adjust to international competition and why those adjustments are uneven.

RELATIONSHIP: his son was also a member of the Yale Swim & Dive team, he’s been an important figure in our recruiting (had a panel with him when getting recruited, did this for many years – has been very engaged in our team) – teaches Behavioral Economics, currently reaching out to him

BENJAMIN POLAK

Benjamin Polak is one of Yale’s most important economists because his work has shaped how economists think about strategy, information, incentives, and decision-making under uncertainty. His research spans game theory, decision theory, social choice, and applied microeconomics, with influential work on common knowledge and rationality, non-expected utility, managerial incentives, and financial systems. He is also especially important at Yale because he is the William C. Brainard Professor of Economics and Professor of Management, and his Game Theory teaching has made him one of the university’s most respected and visible faculty members.

What also adds to his credibility is how strong and unusually broad his academic background is. He earned a B.A. in Economics from Trinity College, Cambridge, with first-class honors, then an M.A. in History from Northwestern, and finally a Ph.D. in Economics from Harvard. That combination matters because it gives him a rare mix of technical rigor, historical perspective, and theoretical depth, which fits the range of his work across economics, management, and institutional thinking. It also makes him feel like more than just a narrow specialist: he comes across as someone with both elite training and real intellectual breadth.

- Brandenburger, Adam, and Benjamin Polak. “When Managers Cover Their Posteriors: Making the Decisions the Market Wants to See.” *RAND Journal of Economics* 27 (1996): 523–541. This paper is important because it shows how outside pressure and reputation concerns can distort decision-making, pushing managers toward choices that look defensible rather than choices that are actually best.
- Polak, Benjamin. “Epistemic Conditions for Nash Equilibrium, and Common Knowledge of Rationality.” *Econometrica* 67 (1999): 673–676. This is one of his best-known theoretical contributions and helped clarify the knowledge assumptions underlying equilibrium behavior in game theory.
- Grant, Simon, Atsushi Kajii, and Benjamin Polak. “Temporal Resolution of Uncertainty and Non-Expected Utility Models.” *Econometrica* 68 (2000): 425–434. This paper is part of his broader contribution to understanding how people make choices when uncertainty unfolds over time and preferences do not fit simple textbook models.
- Baliga, Sandeep, and Benjamin Polak. “The Emergence and Persistence of the Anglo-Saxon and German Financial Systems.” *Review of Financial Studies* 17 (2004): 129–163. This work connects theory and institutional history to explain why financial systems can evolve differently and remain path dependent over long periods.
- Grant, Simon, Atsushi Kajii, Zvi Safra, and Benjamin Polak. “Generalized Utilitarianism and Harsanyi’s Impartial Observer Theorem.” *Econometrica* 78 (2010): 1939–1971. This is a major contribution to welfare economics and social choice, extending the way economists think about aggregation, fairness, and collective decision-making.

RELATIONSHIP:

Took Game Theory – a class taught by him. Very approachable, seemingly humble person. His work would be important in identifying herd behavior, game theory (best responses given a subset of individuals), etc

DUANE LEE

Duane Lee is a finance and operations executive with deep experience across both large institutions and emerging hedge funds. He spent roughly 14 years at Morgan Stanley as an Executive Director in prime brokerage, then moved into senior operating roles at multiple investment firms, including COO positions at Blockhouse Capital Management, Mubadala Capital Public Equities, and Mycor Capital, where he has also served as Chief Compliance Officer. Duane Lee stands out because he has seen both sides of the hedge fund world: the institutional side through a long tenure at Morgan Stanley in prime brokerage, and the entrepreneurial side through COO roles at multiple smaller investment firms. That makes him

valuable not just as a finance professional, but as someone who understands how to actually build and run an investment operation behind the scenes.

RELATIONSHIP: Chris's dad

Toby Moskowitz would give us exposure to the highest level of academic and systematic-finance thinking, helping us ground our ideas in research instead of intuition and pushing us to be more rigorous about what actually holds up. Peter Schott would add a broader economic and policy lens, which matters because markets do not move in a vacuum; his perspective would help us think more clearly about how macro forces, trade, and structural change affect investment opportunities. Duane Lee would bring the practical side that young teams almost always lack: real knowledge of fund operations, prime brokerage, infrastructure, and what it actually takes to build something investable and durable.

Together, that combination would be incredibly valuable because it is not just prestigious, it is complementary. Toby gives us research credibility and systematic-investing insight, Peter gives us deeper judgment about the real economy and structural forces, and Duane gives us the operational and institutional perspective to turn ideas into something real. Just as importantly, their involvement would signal that serious people with real experience believe we are worth investing time in. That kind of mentorship would not only make us better; it would make us more credible, more disciplined, and much more likely to build something with substance.

OTHER POTENTIAL CONTRIBUTORS TO LLC

Kevin Jiang

Student-Athlete, Computer Science at University of Pennsylvania

- Sophomore student-athlete at University of Pennsylvania – walked onto varsity swim team
- 4.14 GPA at Scarsdale High School
- A+ cumulative grade letter average at University of Pennsylvania
- Coursework in Linear Algebra, Probability Theory, Introduction to Artificial Intelligence, Discrete Mathematics, Data Structures and Algorithms, Big Data Analytics
- On the Consumer and Retail Investment Committee at Wharton Asia Exchange
- **RELATIONSHIP:** Close friends with Chris back in NY (same club team, known each other for over 10 years), interested in finance and likely the intersection between finance and CS
 - Contribution could vary, capability is helpful in any division of quantitative research

Zachary Pestrikov

Student-Athlete, Computer Engineering at Caltech

- Junior student-athlete at Caltech, recruited for swimming
- He has built a strong robotics and controls research profile across Caltech, Columbia, and the Toyota Research Institute. At Columbia, he helped develop **GRiD**, a GPU-accelerated rigid body dynamics library, where he wrote second-order dynamics algorithms in CUDA, added

floating-base support for walking robots, and achieved a **9x speedup** over the leading CPU library, Pinocchio; he also presented this work at the **2024 Northeast Robotics Colloquium**. At Toyota Research Institute, he extended this high-performance computing work into autonomous driving by developing **GPU-accelerated ADMM-based optimal control algorithms in JAX** for vehicles operating at the limits of handling.

- Earlier, at Caltech, he worked in the AMBER Lab studying whether **ultrasonic acoustic injection** could influence inertial measurement units. His results found a small increase in sensor noise at the IMU's resonant frequency, but no ability to externally control the device. Overall, the experience shows deep strength in **GPU computing, robotics, dynamics, and optimization**, with applications ranging from legged robots to autonomous vehicles.
- **RELATIONSHIP:** Close friends with Chris back in NY (same club team), known each other for around 10 years), might be more helpful with GPU acceleration/ML processes (not sure how committed he would be but nonetheless, a good resource)
 - His biggest value to your LLC would probably be in **building high-performance research and execution infrastructure**.
 - Someone with experience in GPU acceleration, optimization, CUDA, JAX, and real-time control could help design the kind of backend that makes a quant shop faster and more scalable: large-scale backtesting, faster signal computation, simulation engines, parameter sweeps, portfolio optimization, and low-latency research pipelines. If you want to test many models, many markets, and many scenarios quickly, that kind of engineering becomes a real edge.
 - He could also be useful in **optimization-heavy parts of portfolio management**.
 - His control and ADMM background suggests he may be good at translating messy decision problems into constrained optimization frameworks. In a fund context, that could mean helping with portfolio construction under risk and exposure constraints, execution scheduling, transaction cost minimization, turnover control, leverage budgeting, or even dynamic rebalancing logic. That is not the same as “picking stocks,” but it is very valuable in turning signals into deployable portfolios.
 - Another place he could contribute is **research tooling for systematic strategies**.
 - If your group wants to operate like a serious quant fund, you need more than ideas—you need a research environment that is reproducible, fast, and robust. He could help build infrastructure for simulation, experiment tracking, model benchmarking, stress testing, and possibly GPU-enabled ML workflows. That is especially relevant if you want to do anything with deep learning, alternative data, or large-scale cross-sectional/stat-arb style research.

Hudson Chung

Former Student-Athlete, double major in Computer Science & Economics

Human Behavior is his current company, where he is listed as a Founding Engineer. It is a YC-backed analytics startup in San Francisco that uses AI to watch user sessions and identify why users stay, leave, or convert. Public company descriptions say it is building an AI-powered product analytics platform around user behavior patterns. Public posts tied to Y Combinator and the company say Human Behavior

raised \$5 million in seed funding, with backing from General Catalyst, Y Combinator, Paul Graham, and Vercel Ventures.

FoodFight is the company where he was a Full Stack Engineer Intern. From the public company page, FoodFight appears to be a sports fan engagement platform that lets fans compete in real-time, sports-oriented contests and win food, beverage offers, and prizes from brands and venues. In other words, it looks more like a consumer/sports-tech startup than a deep infrastructure company. I could verify what the company does, but I could not verify a seed amount from the public sources available to me, so I do not want to guess.

Haylon Technologies is where he worked as a Business Development Intern. Haylon is a battery technology company focused on next-generation battery management systems and software, with public descriptions centered on improving rechargeable battery performance across chemistries and use cases. I found public evidence that it has participated in startup/accelerator ecosystems like Techstars Chicago and iVenture, which suggests it is a venture-backed or startup-style company, but I could not confirm a precise seed round amount from the sources I could access

RELATIONSHIP: Known Chris for 11 years (same swim club), has certificate in Prompt Engineering from NVIDIA, uncertain of his commitment considering his heavy, active involvement in a startup

- As a Founding Engineer at a YC company, plus prior full-stack engineering work, he seems like someone who can actually build things fast: internal dashboards, research tools, data workflows, web products, automation systems, and possibly client- or member-facing software.
- Helps with applied AI workflows
